

### **Amendments to the Abstract**

**Please rewrite the amended Abstract, filed September 22, 2010, as follows:**

An antireflection film is provided that prevents the occurrence of interference fringes while having antistatic properties and excellent coating film adhesion. An antireflection film includes a transparent base material film and, provided on the transparent base material film in the following order, an antistatic hardcoat layer including an antistatic agent selected from polymeric antistatic agents, crosslinking group-containing low-molecular antistatic agents, and electrically conductive antistatic agents and having hard properties, and a low-refractive index layer having a lower refractive index than an underlying layer in direct contact with the low-refractive index layer. The occurrence of interference fringes is prevented by bringing the absolute value of the difference between the refractive index of the transparent base material film and the antistatic hardcoat layer to not more than 0.03.
